

1.

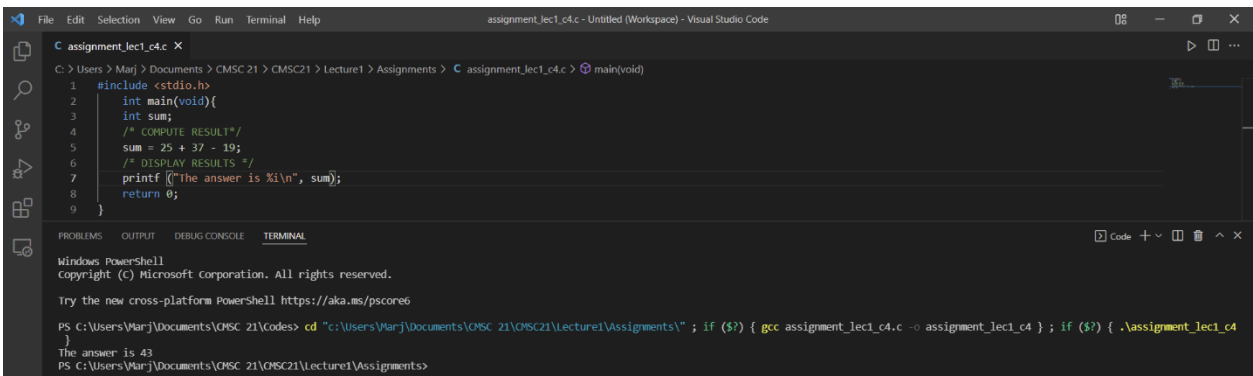

2. Testing.....1...2..3

3.

4. 2nd line – no indentation, void first letter is capitalized, and no opening curly braces
3rd line – int is capitalized
4th line – comment unclosed
5th line – semicolon is missing
6th line – wrong punctuation mark used to close comment
7th line – no comma separating the arguments of the print statement

5. There would be no output because the program results to an error because there is no semicolon after the statement: `answer = 100`. If a semicolon is to be added, then the output is: The result is 95
